

## Adding a Favicon to Your HTML Site

**Objective:** To add a favicon to your HTML site.

As defined by [W3C](#), a favicon is a “graphic image (icon) associated with a particular Web page and/or Web site”. It is the image (icon) that appears in a browser’s title bar or a page’s tab, such as in the image you see below to the left of the text, “CoderGuides”:

This article explains how to add a favicon to your HTML site.

When you create a brand new page in HTML and go to the browser, you will not see a favicon.

It may look like this if you are using Google Chrome.

In order to add a favicon to your site, the first thing you need is an image. This is the image we're going to be using for our favicon in this example. I've named the file of this image "mysite.png".

To add this image as the favicon, we're going to add a line of code to the `<head>` section of our code (line 6). We add the `rel` attribute value of "icon", along with image file in the `href` attribute. The `rel` attribute is used to define the value. In this case, the value is defined as the "icon" representing the current document. Make sure to use the correct path for your image inside the `href` attribute. In this example, the "mysite.png" image is in a folder called **images**, which is itself inside a folder called **assets**. Your code should look like this (line 6). Make sure to do this for each HTML page of your website, so that the favicon appears on every page in the browser.

```
1 <!DOCTYPE html>
2 <html lang="en">
3
4 <head>
5   <title>MySite</title>
6   <link rel="icon" type="image/png" href="assets/images/mysite.png">
7   -- REST OF CODE --
8 </head>
```

And that's all you have to do. And now when we refresh the page in the browser, we can see our favicon:

And in Google Chrome, it would look like this:
